Novocastra™ Lyophilized Mouse Monoclonal Antibody Dystrophin (C-terminus)

Product Code: NCL-DYS2

Intended Use
FOR RESEARCH USE ONLY.

Specificity
Reacts strongly with the carboxy terminus (between amino acids 3669 and 3685) of human dystrophin. Also crossreacts strongly with skeletal, cardiac and smooth muscle dystrophin from normal mouse, rat, rabbit, dog, chicken and hamster. No crossreactivity with mdx mouse tissue. Crossreacts very weakly with pig dystrophin.

Clone
Dy8/6C5

Ig Class
IgG1

Antigen Used for Immunizations
Synthetic polypeptide consisting of the last 17 amino acids at the carboxy terminus of the human dystrophin sequence (SSRGRNTPGKPMREDTM).

Hybridoma Partner
Mouse myeloma (X63.Ag8.653) x CD1.

Preparation
Lyophilized tissue culture supernatant containing 15 mM sodium azide. Reconstitute with the volume of sterile distilled water indicated on the vial label.

Effective on Frozen Tissue
Yes - unfixed.

Effective on Paraffin Wax Embedded Tissue
No

Recommendations on Use
Immunohistochemistry: Typical working dilution NEAT-1:20. Indirect immunoperoxidase technique (see overleaf). Western Blotting: Typical working dilution 1:10–1:25. Electron microscopy gold. Light fixation with 2% formaldehyde + 0.001% glutaraldehyde for 1 hour, 2.3 M sucrose used as cryoprotectant is recommended. Typical working dilution NEAT. 90 minutes primary antibody incubation at 25 °C.

Positive Controls
Immunohistochemistry: Snap frozen normal human or rat striated muscle. Western Blotting: Skeletal muscle.

Staining Pattern
Light microscope: continuous rim of labelling at the periphery of muscle fibres. Western blotting: single strong band at approximately 400 kD. Electron microscopy gold: at plasma membrane.

Storage and Stability
Store unopened lyophilized antibody at 4 °C. Under these conditions, there is no significant loss in product performance up to the expiry date indicated on the vial label. The reconstituted antibody is stable for at least two months when stored at 4 °C. For long term storage, it is recommended that aliquots of the antibody are frozen at -20 °C (frost-free freezers are not recommended). Repeated freezing and thawing must be avoided. Prepare working dilutions on the day of use.

General Overview
Duchenne muscular dystrophy (DMD) is the most severe of the muscular dystrophies resulting in progressive muscular wasting and death. Dystrophin is the product of the DMD/BMD (Duchenne Muscular Dystrophy/Becker Muscular Dystrophy) gene located on the X chromosome at position Xp21. Western blotting and immunohistochemistry are the two established methods for use in research studies for the detection of abnormalities of dystrophin expression in muscle biopsies. Important: For reliable interpretation of dystrophin labelling patterns using tissue sections, the use of a SPECTRIN control is essential.

General References
Instructions for Use

Protocol for Immunohistochemical Use of Monoclonal Antibodies to Dystrophin; NCL-DYS1, NCL-DYS2 and NCL-DYS3

1. Freeze muscle blocks in isopentane chilled in liquid nitrogen.
2. Cut 4–10 µm sections and air dry on slides coated with tissue adhesive.
3. Slides may be stored at -70 °C wrapped in cling film until required. If stored sections are used, allow sections to equilibrate to room temperature before unwrapping and proceeding.
4. Apply a 50 µL aliquot of primary antibody to section (unfixed). Incubate for 1 hour at 25 °C or 37 °C.
5. Wash sections 3 x 10 minutes in phosphate buffered saline.
6. Apply a 50 µL aliquot of labelled secondary antibody. Incubate for 1 hour at 25 °C.
7. Wash sections 3 x 10 minutes in phosphate buffered saline.
8. Mount fluorescent sections in aqueous mountant or visualize peroxidase label (e.g. by exposure to freshly prepared 0.05% w/v diaminobenzidine in phosphate buffered saline containing 0.1% w/v hydrogen peroxide). Dehydrate, clear and mount peroxidase labelled sections for permanent preparations.
